Table of Contents

1. Panel integration	4
1.1 AWBS integration	4
1.2 ClientExec integration	4
1.3 HostBill	5
1.4 Hosting Controller integration	5
1.5 ISSystem integration	6
1.6 WeFact integration	6
1.7 WHMCS integration	6

Our free modules enable you to easily integrate your control panel of choice and start to automatically register and manage your domain names in no time.

Below are the details per control panel.

AWBS integration

AWBS integration

About AWBS

Whether starting new or looking to expand your existing web hosting and/or domain registration business, the AWBS fully automated solutions and unique features will allow you achieve your goal with minimum effort and cost.

With its many features AWBS is truly an Advanced Webhosting Billing System, containing all the essential tools you will ever need to signup, bill, maintain and support your clients.

How to use Realtime Register with AWBS

AWBS is deployed with Realtime Register integration. In the AWBS settings you can setup your Realtime Register account details, to be able to connect to your account for realtime domain registrations. For help with your AWBS configuration, please check the AWBS support at <http://www.awbs.com/contact.php>

ClientExec integration

ClientExec integration

About ClientExec

ClientExec offers customer management, support and billing. You can use the Realtime Register module for easy and fast domain registration. We have developed a ClientExec module that can be downloaded from this page.

Configuration

- [Download the ClientExec module here](#)

Unzip the module to the following location:

- /plugins/registrars/

The module is automatically detected by ClientExec. You can configure the module via

"SYSTEM SETUP -> domain settings -> registrars - plugins"

Module features

- Username: Your Realtime Register account username.
- Password: Your Realtime Register account password.
- Handle: A contact handle that will be used for admin / billing / tech by default. When omitted, new admin, billing and tech contacts will be created every time a domain is registered! .DE domains require a fax number for the tech contact. Since ClientExec does not provide a field for this, you can manually create a contact with a fax number in the Realtime Register webinterface, and specify the handle here.
- TestMode: Whether to use the testing environment of Realtime Register. Be sure to register for a test account. Please contact our support desk to create a test account.
- DebugMode: Debug mode provides extensive information when an error occurs. You should only enable this for debugging purposes!
- DebugMail: Debug messages are mailed to this e-mail address.

WHMCS / ClientExec Phone number format

Realtime Register requires the phone number of contacts to be in the E.164 format, specified by the ITU-T. Since some systems store phone numbers in a different format, a flexible solution was created.

Custom format

We allow resellers to specify the format in which phone numbers are stored in **their** system. Whenever the Realtime Register module is invoked, the phone numbers will be automatically converted on the fly. Note that no data is actually modified!

A phone number consists of a country code, an area code and a subscriber number. These separate parts are designated by the following symbols:

- %c = country code (eg. 31 for The Netherlands)
Optional. When omitted, the Realtime Register module will automatically attempt to determine the correct country code by looking at the country of the customer.
- %a = area code (eg. 38 for Zwolle)
Optional. In some countries an area code does not exist.
- %s = subscriber number (eg. 4530759)
May only contain digits and spaces.

Examples

The following examples demonstrate how these symbols can be used to specify a phone number format:

Number: +31 (0) 38 453 0759
Format: +%c (0) %a %s

Number: 0031 038 4530759
Format: 00%c 0%a %s

Number: 038-4530759
Format: 0%a-%s

HostBill

Hostbill integration

About Hostbill

HostBill provides a billing, automation, support and client management solution with features for domain registration, domain transfer and domain renewal.

Installing HostBill

Instructions for the installation of HostBill you will find at <http://hostbillapp.com/install/>

Connecting HostBill with Realtime Register

1. In HostBill go to **Settings > Modules**, find and activate **Realtime Register** module
2. You will be taken to **Settings > Apps** to set connection with Realtime Register
3. Enter your username and password use Test Connection to check if HostBill can connect
4. Save Changes

Creating your first domain package

1. In HostBill go to **Settings > Products & Services**, and **Add new order page**
2. From **Order Types** select **Domains**
3. *After creating order page add new product, one in it, provide a name*
4. In product configuration section proceed to **Registrar Settings**, select Realtime Register module as **Third party app**.
5. Save changes, your package is ready
6. Some TLDs will need additional information provided by clients, in that case HostBill will notify you by highlighting **Forms** section.

Hosting Controller integration

Hosting Controller integration

About Hosting Controller

Hosting Controller is a complete web hosting automation control panel designed for web hosts to manage both Windows & Linux servers through centralized interface in a cluster environment

You can use the Realtime Register module for easy and fast domain registration. We have a partnership with Hosting Controller in order for Hosting Controller users to be able to use Realtime Register for domain registration from within the Hosting controller Software.

Configuration

Link to the manual on how to configure Realtime Register with HC:

- [PDF format](#)
- [HTML format](#)

ISPsystem integration

ISPsystem integration

About ISPsystem

ISPsystem integration offers a complete line of flexible solutions for hosting automation and management needs.

How to use Realtime Register with ISPsystem

Please contact the [ISPsystem support](#) for instructions on how to incorporate Realtime Register with your ISPsystem installation.

WeFact integration

WeFact integration

About WeFact

WeFact Hosting is a Dutch administration and billing system, designed specifically for the hosting business

How to use Realtime Register with WeFact

WeFact Hosting is deployed with Realtime Register integration. In the WeFact Hosting settings you can setup your Realtime Register account details, to be able to connect to your account for realtime domain registrations.

For assistance in setting up, please contact [WeFact support](#).

WHMCS integration

About WHMCS

WHMCS is an all-in-one client management, billing & support solution for online businesses.

Configuration

- <https://www.realtimeregister.com/integration/control-panel-integration/whmcs>

Unzip the module to the following location:

- /modules/registrar/

The module is automatically detected by WHMCS. You can configure the module via "Setup -> Domain Registrars"

Module features

- Username: Your Realtime Register account username.
- Password: Your Realtime Register account password.
- Handle: A contact handle that will be used for admin / billing / tech by default. When omitted, new admin, billing and tech contacts will be created every time a domain is registered. .DE domains require a fax number for the tech contact. Since WHMCS does not provide a field for this, you can manually create a contact with a fax number in the Realtime Register webinterface, and specify the handle here.
- Trade: Request transfers with a trade (change of ownership), otherwise request a normal transfer.
- TestMode: Whether to use the testing environment of Realtime Register. Please contact our support desk to create a test account.
- DebugMode: Debug mode provides extensive information when an error occurs. You should only enable this for debugging purposes.
- DebugMail: Debug messages are mailed to this e-mail address.

WHMCS / ClientExec Phone number format

Realtime Register requires the phone number of contacts to be in the E.164 format, specified by the ITU-T. Since some systems store phone numbers in a different format, a flexible solution was created.

Custom format

We allow resellers to specify the format in which phone numbers are stored in **their** system. Whenever the Realtime Register module is invoked, the phone numbers will be automatically converted on the fly. Note that no data is actually modified!

A phone number consists of a country code, an area code and a subscriber number. These separate parts are designated by the following symbols:
